

Cerulean

Cerulean, part of Molins PLC, is introducing a new portable carton tester.

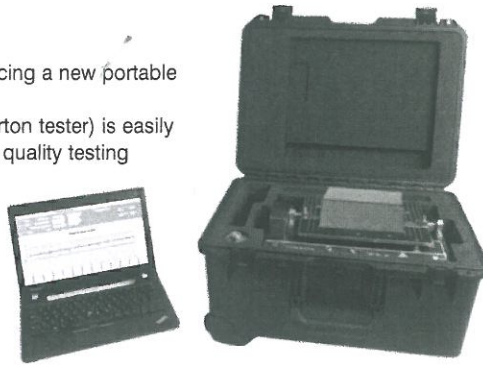

The Cerulean Newton PCT (portable carton tester) is easily calibrated and fully transportable for rapid quality testing in situ. It is suitable for testing whole cartons made from corrugated, paper board and waxed carton board up to 230mm wide and 8mm thick.

Housed in a rugged Storm case with pre-programmed integral lap top, the PCT combines three essential quality control tests. It measures crease strength, spring back and box-forming force. It also evaluates friction properties to identify potential carton sticking and feeding problems. Data analysis and reporting is provided through the unit's integral graphic user interface

The PCT measures the torque required to form a crease and produces an instantaneous curve that shows the torque for every degree of deflection. The results facilitate easy comparison between batches and carton types to help achieve performance consistency over time and for multiple sites.

Allen Coding

As part of its on-going strategy to target further growth in emerging global markets, Allen Coding will be showing its high performance XL-Series of thermal transfer units for the first time. The new models feature advanced Unicode capability and iView colour touch screen for easy real-time and variable multi language printing. Other equipment on display will include the popular Hitachi RX-S inkjet printer, ICON laser coder and TJ thermal inkjet printers.

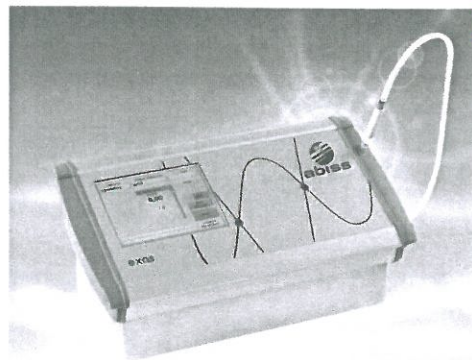

As well as a two component, space saving design, the XL-Series offers several exciting new features, including iView colour touch screen with simple-to-use graphical user interface for convenient multi-printer operation, Ethernet and USB connectivity, and dual processors (one for communication and one for printing) to ensure high speed performance.

While many thermal transfer technologies advertise they are 'Unicode-ready', it normally means that language characters are used as locked images. This does not mean they offer true real-time, variable print Unicode capabilities.

Aneolia

Aneolia innovates in developing new instruments for R&D and quality controls of food packaging.

Its brand abiss proposes a large range of solutions: gas analysers for modified atmosphere packaging, leak analysers for various kinds of packaging, seal and burst testers.

Aneolia has also developed a breakthrough technology to help manufacturers to obtain a better understanding of their packaging: Exos.

Exos is a unique solution giving you a complete vision of your packaging

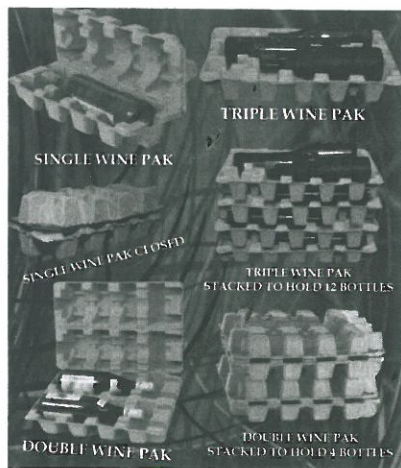

Do you really control your packaging?

integrity. In one device, Exos combines: leak analysis, burst testing, and gas analysis for MAP.

Already used by some of the market leaders in snack and biscuit manufacturing, Exos is now receiving a growing interest for dairy products. You can try the device at the show by visiting the Aneolia booth.

Henry AR

Henry AR are your one-stop-shop for moulded fibre packaging.

Henry's Wine Paks (wine bottle shippers) in a variety of pack sizes, bespoke packaging and standard stock protection pieces are moulded from pre and post-consumer newsprint, Kraft paper and other selected waste papers. Henry's portfolio also includes products such as the market leading STAKKERS (roll support cradles) and horticultural containers

including floristry products.

As well as standard stock protection pieces, bespoke packaging is a speciality of Henry Molded which is the design, development and manufacturing leader in full line moulded pulp products.

Using a moulded fibre product is an efficient, environmentally friendly way to protect your products and contribute to your organisation's sustainability goals. To find out more how they can help you with your projects, contact Steve Benn at HENRY AR.
